## Aliases

- **Definition**
  - alias Name = Value
    - alias is the name of a new builtin command.
    - Name and value must be tokens. Value might be a string token.
- **Substitution**
  - While parsing (see below) see if the first token on a command line is an alias Name. If so, substitute Value for it.
    - Need to tokenize Value in case it was a string with spaces in it.
