Table of contents

Conventions

A number of conventions are used in this document. These conventions are detailed below.

☒ Warning Message. These messages warn you that actions may damage your hardware.

✳ Handy Note. These messages draw your attention to crucial pieces of information.

Hexadecimal numbers will appear throughout this document. The convention used is that of prefixing the number with '0x' in common with standard C syntax.

Sections of code or commands that you must type are given in typewriter font like this:

```
void main();
```

Information about a type of object you must specify is given in italics like this:

`copy` ***`SourceFileName DestinationFileName`***

Optional elements are enclosed in square brackets like this:

struct [type_Name]

Curly brackets around an element show that it is optional but it may be repeated any number of times.

string ::= "{***character***}"

Assumptions

This manual assumes that you:

- have used Handel-C or have the Handel-C Language Reference Manual
- are familiar with common programming terms (e.g. functions)
- are familiar with MS Windows

1. Fixed-point library

The Fixed-point Library is installed as a library (.hcl) file with a header (.hch) file. The library is not board or device specific.

The fixed.hch header file must be included at the start of your program. It provides macro prototype declarations and preprocessor definitions. The functionality is stored in the fixed.hcl library file that must be added to your project within the GUI. This is done on the **Project Settings** dialog: Select the **Linker** tab and then type 'fixed.hcl' in the **Object/library modules** box.

Handel-C libraries and header files previously used the .lib and .h extensions. The fixed-point library is now only supplied as a .hch and .hcl file.

To use the library, you must first define a structure to hold the fixed-point number. Fixed-point numbers are represented as signed or unsigned structures.

The macros included in the fixed-point library can be grouped as:

- Bit Manipulation Operators
- Arithmetic Operators
- Relational Operators
- Bitwise Logical Operators
- Conversion Operators

Bit Manipulation Operators

- FixedLeftShift(***fixed_Name***, ***variable_Shift***)
- FixedRightShift(***fixed_Name***, ***variable_Shift***)

Arithmetic Operators

- FixedNeg(***fixed_Name***)
- FixedAdd(***fixed_Name1***, ***fixed_Name2***)
- FixedSub(***fixed_Name1***, ***fixed_Name2***)
- FixedMultSigned(***fixed_Name1***, ***fixed_Name2***)
- FixedMultUnsigned(***fixed_Name1***, ***fixed_Name2***)
- FixedDivSigned(***fixed_Name1***, ***fixed_Name2***)
- FixedDivUnsigned(***fixed_Name1***, ***fixed_Name2***)
- FixedAbs(***fixed_Name***)

Relational Operators

- FixedEq(***fixed_Name1***, ***fixed_Name2***)
- FixedNEq(***fixed_Name1***, ***fixed_Name2***)
- FixedLT(***fixed_Name1***, ***fixed_Name2***)

- `FixedLTE(`***fixed_Name1***, ***fixed_Name2***`)`
- `FixedGT(`***fixed_Name1***, ***fixed_Name2***`)`
- `FixedGTE(`***fixed_Name1***, ***fixed_Name2***`)`

Bitwise Logical Operators

- `FixedNot(`***fixed_Name***`)`
- `FixedAnd(`***fixed_Name1***, ***fixed_Name2***`)`
- `FixedOr(`***fixed_Name1***, ***fixed_Name2***`)`
- `FixedXor(`***fixed_Name1***, ***fixed_Name2***`)`

Conversion Operators

- `FixedIntWidth(`***fixed_Name***`)`
- `FixedFracWidth(`***fixed_Name***`)`
- `FixedToInt(`***fixed_Name***`)`
- `FixedToBool(`***fixed_Name***`)`
- `FixedToBits(`***fixed_Name***`)`
- `FixedCastSigned(`***isSigned***, ***intWidth***, ***fracWidth***, ***fixed_Name***`)`
- `FixedCastUnsigned(`***isSigned***, ***intWidth***, ***fracWidth***, ***fixed_Name***`)`
- `FixedLiteral(`***isSigned***, ***intWidth***, ***fracWidth***, ***floatConst***`)`
- `FixedLiteralFromInts(`***isSigned***, ***intWidth***, ***fracWidth***, ***intBits***, ***fracBits***`)`

1.1 Fixed-point notation

Mathematical notation (as in a decimal coinage system) in which the point separating whole numbers and fractions is in a fixed position.

1.2 Fixed-point library header file

To use the fixed-point library the header file `fixed.hch` needs to be included at the top of your program.

Previous versions of Handel-C used `.h` as the extension for header files. The fixed-point library is now only supplied as a `.hch` and `.hcl` file.

Example

```
#include <fixed.hch>
set clock = external "P1";
typedef FIXED_SIGNED(4, 4) MyFixed;

void main(void)
{
    MyFixed fixed1, fixed2;
    // Give the fixed-point number value –0.75
    fixed1 = FixedLiteral(FIXED_ISSIGNED, 4, 4, -1, 4);
    // Shift this number right by 1 bit
    fixed2 = FixedRightShift(fixed1, 1);
}
```

1.2.1 FIXED_ISUNSIGNED

FIXED_ISUNSIGNED

Description

This is a constant defined as 0. It is used to specify that a fixed-point value is unsigned. It does not define a FIXED_UNSIGNED structure.

Requirements

Header file:	fixed.hch

Example

This definition is for use with FixedLiteral, FixedLiteralFromInts or casting:

```
#include <fixed.hch>
set clock = external "P1";
typedef FIXED_UNSIGNED(4, 8) MyFixed;

void main(void)
{
    MyFixed fixed1;
    // Assign the value 4.5 to a signed fixed-point structure
    fixed1 = FixedLiteral(FIXED_ISUNSIGNED, 4, 8, 4.5);
}
```

```
The result is 4.5 stored as a signed fixed-point number:
fixed2.FixedIntBits = 4;
fixed2.FixedFracBits = 128;
```

1.2.2 FIXED_ISSIGNED

FIXED_ISSIGNED

Description

This is a constant defined as 1. It is used to specify that a fixed-point value is signed. It does not define a FIXED_SIGNED structure.

Requirements

Header file: fixed.hch

Example

This definition is for use with FixedLiteral, FixedLiteralFromInts or casting:

```
#include "fixed.hch"
set clock = external "P1";
typedef FIXED_SIGNED(4, 4) MyFixedSigned;
typedef FIXED_UNSIGNED(4, 4) MyFixedUnsigned;
void main(void)
{
    MyFixedSigned fixed1;
    MyFixedUnsigned fixed2;
    // Assign the value 1.25 to a signed fixed-point structure
    fixed1 = FixedLiteral(FIXED_ISSIGNED, 4, 4, 1.25);
    // Cast to unsigned
    fixed2 = FixedCastSigned(FIXED_ISUNSIGNED, 4, 4, fixed1);
}
```

The result is still 1.25 but stored as a signed fixed-point number:

```
fixed2.FixedIntBits = 1;
fixed2.FixedFracBits = 4;
```

1.3 Fixed-point structures

The fixed-point structures in the library are divided into two types: signed and unsigned. This is to ensure maximum efficiency for the user. When positive and negative numbers are required, use signed fixed-point numbers. When only positive numbers are required, use unsigned fixed-point numbers.

1.3.1 Signed fixed-point structures

To use signed fixed-point numbers in the fixed-point library, first you must define a structure with the following definition:

FIXED_SIGNED(***intWidth***, ***fracWidth***) ***Fixed***;

This sets the width of the integer part of the number ***intWidth*** and the width of the fraction part of the number ***fracWidth***. These widths can be any positive number including zero but must be compile time constants.

The definition creates a structure of the form:

```
struct {
    signed intWidth FixedIntBits;
    signed fracWidth FixedFracBits;
};
```

The integer part of the number has width ***intWidth*** and is held in:

Fixed`.FixedIntBits`

The fraction part of the number has width ***fracWidth*** and is held in:

Fixed`.FixedFracBits`

1.3.2 FIXED_SIGNED

`FIXED_SIGNED( intWidth, fracWidth );`

Arguments

intWidth	Width of integer part of the fixed-point structure. Must be positive and a compile time constant.
fracWidth	Width of fraction part of the fixed-point structure. Must be positive and a compile time constant.

Return values

None.

Description

Defines a structure to hold a signed fixed-point number of the type required for the other functions in the library. The structure takes the form:

```
struct
{
   signed intWidth FixedIntBits;
   signed fracWidth FixedFracBits;
};
```

Requirements

Header file:	fixed.hch

Example

The suggested method of usage is to use this definition to create a type definition as follows:

```
typedef FIXED_SIGNED(intWidth, fracWidth) MyFixed;
MyFixed fixed1, fixed2;
```

1.3.3 Converting positive numbers to signed fixed-point structures

To convert a positive number to a fixed point structure you must define a FIXED_SIGNED structure to contain the number, and then assign it values using the FixedLiteral function.

Example

This shows how to define a 6-bit fixed-point number with 4 integer bits and 2 fraction bits, and then assign the value 3.5 to it.

```
#include <fixed.hch>
set clock = external "P1";
// Define a name for the structure type
typedef FIXED_SIGNED(4, 2) MyFixed;

void main(void)
{
    // Declare variable of type
    MyFixed fixedNumber;
    // Give fixedNumber the value 3.5
    fixedNumber = FixedLiteral(FIXED_ISSIGNED, 4, 2, 3.5);
}
```

This is stored as

```
fixedNumber.FixedIntBits = 3
fixedNumber.FixedFracBits = 2
```

Explanation

FixedLiteral(***isSigned*** , ***intWidth*** , ***fracWidth*** , ***floatConst***);
returns a signed fixed-point number if ***isSigned*** is 1 or an unsigned fixed-point number if ***isSigned*** is 0. The number has the value ***floatConst*** with an integer part of width ***intWidth*** and a fraction part of width ***fracWidth***.

The FixedLiteral function

- Sets ***Fixed***.fixedIntBits to the value of the integer part of the number.
- Finds 2 to the power of the number of fraction bits, ***fracWidth***.
- Multiplies this with the decimal part of the number.

- Rounds to the nearest integer and set ***Fixed***.FixedFracBits to this value.

For a number ***a.b*** the formulae are:

- *Fixed*.FixedIntBits = ***a***
- *Fixed*.FixedFracBits = integer part of (***b*** x $2^{fracWidth}$)

1.3.4 Converting negative numbers to signed fixed-point structures

To convert a negative number to a fixed point structure you must define a FIXED_SIGNED structure to contain the number, and then assign it values using the FixedLiteral function.

Example

This shows how to define an 8 bit fixed-point number with 4 integer bits and 4 fraction bits, and then assign the value –3.5 to it.

```
#include <fixed.hch>
set clock = external "P1";
// Define a name for the structure type
typedef FIXED_SIGNED(4, 4) MyFixed;

void main(void)
{
    // Declare variable of type
     MyFixed fixedNumber;
    // Give fixedNumber the value –3.5
    fixedNumber = FixedLiteral(FIXED_ISSIGNED, 4, 4, -3.5);
}
```

This is stored as

```
fixedNumber.FixedIntBits = -4
fixedNumber.FixedFracBits = 8
```

Explanation

FixedLiteral(***isSigned*** , ***intWidth*** , ***fracWidth*** , ***floatConst***);
returns a signed fixed-point number if ***isSigned*** is 1 or an unsigned fixed-point number if ***isSigned*** is 0. The number has the value ***floatConst*** with an integer part of width ***intWidth*** and a fraction part of width ***fracWidth***.

The FixedLiteral function

- Sets ***Fixed***.FixedIntBits to the value of the integer part of the number.
- Finds 2 to the power of the number of fraction bits, ***fracWidth***, takes the decimal part of the number from 1 and multiplies them together

- Rounds to the nearest integer and set ***Fixed***.FixedFracBits to this value.
- If ***Fixed***.FixedFracBits is zero then does not change ***Fixed***.FixedIntBits.
- If ***Fixed***.FixedFracBits is not zero takes 1 from ***Fixed***.FixedIntBits.

For a number ***a***.***b*** the formulae are:

- ***Fixed***.FixedFracBits = integer part of ((1-***b***) x $2^{fracWidth}$)
- If ***Fixed***.FixedFracBits is zero: ***Fixed***.FixedIntBits = ***a***
- Else if ***Fixed***.FixedFracBits is not zero: ***Fixed***.FixedIntBits = ***a***-1

1.4 Unsigned fixed-point structures

To use unsigned fixed-point numbers in the fixed-point library, first you must define a structure with the following definition:

FIXED_UNSIGNED(***intWidth***, ***fracWidth***) ***Fixed***;

This sets the width of the integer part of the number ***intWidth*** and the width of the fraction part of the number ***fracWidth***. These widths can be any positive number including zero but must be compile time constants.

The definition creates a structure of the form:

```
struct {
    unsigned intWidth FixedIntBits;
    unsigned fracWidth FixedFracBits;
} ;
```

The integer part of the number has width ***intWidth*** and is held in

Fixed.FixedIntBits

The fraction part of the number has width ***fracWidth*** and is held in:

Fixed.FixedFracBits

1.4.1 FIXED_UNSIGNED

FIXED_UNSIGNED(***intWidth***, ***fracWidth***);

Arguments

intWidth	Width of integer part of the fixed-point structure. Must be positive and a compile time constant.
fracWidth	Width of fraction part of the fixed-point structure. Must be positive and a compile time constant.

Return values

None.

1. Fixed-point library

Description

Defines a structure to hold an unsigned fixed-point number of the type required for the other functions in the library. The structure takes the form:

```
struct
{
   unsigned intWidth FixedIntBits;
   unsigned fracWidth FixedFracBits;
};
```

Requirements

Header file: fixed.hch

Example

The suggested method of usage is to use this definition to create a type definition as follows:

```
typedef FIXED_UNSIGNED(intWidth, fracWidth) MyFixed;
MyFixed fixed1, fixed2;
```

1.4.2 Converting numbers to unsigned fixed-point structures

To convert a number to an unsigned fixed point structure you must define a FIXED_UNSIGNED structure to contain the number, and then assign it values using the FixedLiteral function.

Example

To define an 8 bit fixed-point number with 4 integer bits and 4 fraction bits, and then assign the value 10.5 to it.

```
#include <fixed.hch>
set clock = external "P1";
// Define a name for the structure type
typedef FIXED_UNSIGNED(4, 4) MyFixed;

void main(void)
{
    // Declare variable of type
    MyFixed fixedNumber;
    // Give fixedNumber the value 10.5
    fixedNumber = FixedLiteral(FIXED_ISUNSIGNED, 4, 4, 10.5);
}
```

This is stored as:

```
fixedNumber.FixedIntBits = 10
fixedNumber.FixedFracBits = 8
```

Explanantion

FixedLiteral(***isSigned*** , ***intWidth*** , ***fracWidth*** , ***floatConst***);
returns a signed fixed-point number if ***isSigned*** is 1 or an unsigned fixed-point number if ***isSigned*** is 0. The number has the value ***floatConst*** with an integer part of width ***intWidth*** and a fraction part of width ***fracWidth***.

The FixedLiteral function

- Sets ***Fixed***.fixedIntBits to the value of the integer part of the number.
- Finds 2 to the power of the number of fraction bits, ***fracWidth***.
- Multiplies this with the decimal part of the number.
- Rounds to the nearest integer and set ***Fixed***.FixedFracBits to this value.

For a number ***a***.***b*** the formulae are:

- ***Fixed***.FixedIntBits = ***a***
- ***Fixed***.FixedFracBits = integer part of (***b*** x $2^{fracWidth}$)

1.5 Fixed point functions

1.5.1 FixedAbs

FixedAbs(***Fixed***);

Arguments

Fixed	Fixed-point structure of signed type and any width

Return values

Fixed-point number of signed type and same width as ***Fixed***.

Description

Returns the absolute value of ***Fixed***. The number returned is of the same width as ***Fixed*** so any bits outside this width are lost. Signed integers use 2's complement representation in Handel-C so

abs(max positive number) < abs(min negative number)

This means the function gives the result:

abs(min negative number) = min negative number.

Requirements

Header file:	`fixed.hch`
Library file:	`fixed.hcl`

Example

This example shows finding the absolute value of a `FIXED_SIGNED(4, 4)`.

```
#include <fixed.hch>
set clock = external "P1";
typedef FIXED_SIGNED(4, 4) MyFixed;

void main(void)
{
    MyFixed fixed1, fixed2;
    // Give the fixed-point number value –7.25
    fixed1 = FixedLiteral(FIXED_ISSIGNED, 4, 4, -7.25);
    // Find the absolute value of this number
    fixed2 = FixedAbs(fixed1);
}
```

The result is 7.25. This is stored as:

```
fixed2.FixedIntBits = 7;
fixed2.FixedFracBits = 4;
```

1.5.2 FixedAdd

`FixedAdd(` ***`Fixed1`***`,` ***`Fixed2`*** `);`

Arguments

Fixed1	Fixed-point structure of any type and width
Fixed2	Fixed-point structure of the same type and width

Return values

Fixed-point number of the same type and width as ***Fixed1*** and ***Fixed2***.

Description

Returns ***Fixed1*** added to ***Fixed2***. The number returned is of the same width as ***Fixed1*** so any bits outside this width are lost.

Requirements

Header file:	fixed.hch
Library file:	fixed.hcl

Example

This example shows addition on two FIXED_UNSIGNED(4, 8).

```
#include <fixed.hch>
set clock = external "P1";
typedef FIXED_UNSIGNED(4, 8) MyFixed;

void main(void)
{
    MyFixed fixed1, fixed2, fixed3;
    // Give the fixed-point number value 3.25
    fixed1 = FixedLiteralFromInts(FIXED_ISUNSIGNED, 4, 8, 3, 64);
    // Give the fixed-point number value 4.75
    fixed2 = FixedLiteralFromInts(FIXED_ISUNSIGNED, 4, 8, 4, 192);
    // Add the numbers together
    fixed3 = FixedAdd(fixed1, fixed2);
}
```

The result is 8. This is stored as:

```
fixed3.FixedIntBits = 8;
fixed3.FixedFracBits = 0;
```

1.5.3 FixedAnd

FixedAnd(***Fixed1***, ***Fixed2***);

Arguments

Fixed1	Fixed-point structure of any type and width
Fixed2	Fixed-point structure of the same type and width

Return values

Fixed-point number of the same type and width as ***Fixed1*** and ***Fixed2***.

Description

Returns bitwise AND of ***Fixed1*** and ***Fixed2***.

Requirements

Header file:	fixed.hch
Library file:	fixed.hcl

Example

This example finds the bitwise AND of two FIXED_UNSIGNED(0, 16).

```
#include <fixed.hch>
set clock = external "P1";
typedef FIXED_UNSIGNED(0, 16) MyFixed;

void main(void)
{
    MyFixed fixed1, fixed2, fixed3;
    // Give the fixed-point number value 0.02734375
    fixed1 = FixedLiteralFromInts(FIXED_ISUNSIGNED, 0, 16, 0, 1792);
    // Give the fixed-point number value 0.234375
    fixed2 = FixedLiteralFromInts(FIXED_ISUNSIGNED, 0, 16, 0, 15360);
    // And these numbers
    fixed3 = FixedAnd(fixed1, fixed2);
}
```

The result is 0.015625. This is stored as:

```
fixed3.FixedIntBits = 0;
fixed3.FixedFracBits = 1024;
```

1.5.4 FixedCastSigned

FixedCastSigned(***isSigned***, ***intWidth***, ***fracWidth***, ***Fixed***);

If you need to cast from a signed number to a fixed-point signed or fixed-point unsigned number, use FixedCastSigned. If you need to cast from an unsigned number, used FixedCastUnsigned.

Arguments

isSigned	Compile time constant to indicate the type of fixed-point structure. FIXED_ISSIGNED represents signed and FIXED_ISUNSIGNED represents unsigned.
intWidth	Width of integer part of the fixed-point structure. Must be positive and a compile time constant.
fracWidth	Width of fraction part of the fixed-point structure. Must be positive and a compile time constant.
Fixed	Fixed-point structure of signed type and any width.

Return values

Fixed-point structure of the type and width specified.

Description

Casts any signed fixed-point number to the type and width specified. Any bits added will be sign extended and any bits lost will be truncated.

Requirements

Header file:	fixed.hch
Library file:	fixed.hcl

Example

This example casts a FIXED_SIGNED(4, 4) to a FIXED_UNSIGNED(4, 4).

```
#include <fixed.hch>
set clock = external "P1";
typedef FIXED_SIGNED(4, 4) MyFixedSigned;
typedef FIXED_UNSIGNED(4, 4) MyFixedUnsigned;

void main(void)
{
    MyFixedSigned fixed1;
    MyFixedUnsigned fixed2;
    // Assign the value 7.125
    fixed1 = FixedLiteral(FIXED_ISSIGNED, 4, 4, 7.125);
    // Cast to unsigned
    fixed2 = FixedCastSigned(FIXED_ISUNSIGNED, 4, 4, fixed1);
}
```

The result is still 7.125 but stored as a signed fixed-point number:

```
fixed2.FixedIntBits = 7;
fixed2.FixedFracBits = 2;
```

1.5.5 FixedCastUnsigned

FixedCastUnsigned(***isSigned***, ***intWidth***, ***fracWidth, Fixed***);

If you need to cast from an unsigned number to a fixed-point signed or fixed-point unsigned number, use FixedCastUnsigned. If you need to cast from a signed number, used FixedCastSigned.

Arguments

isSigned	Compile time constant to indicate the type of fixed-point structure. FIXED_ISSIGNED represents signed and FIXED_ISUNSIGNED represents unsigned.
intWidth	Width of integer part of the fixed-point structure. Must be positive and a compile time constant.
fracWidth	Width of fraction part of the fixed-point structure. Must be positive and a compile time constant.
Fixed	Fixed-point structure of unsigned type and any width.

Return values

Fixed-point structure of the type and width specified.

Description

Casts any unsigned fixed-point number to the type and width specified. Any bits added will 0 and any bits lost will be truncated.

Requirements

Header file:	fixed.hch
Library file:	fixed.hcl

Example

This example casts a FIXED_UNSIGNED(4, 4) to a FIXED_UNSIGNED(16, 16).

```
#include <fixed.hch>
set clock = external "P1";
typedef FIXED_UNSIGNED(4, 4) MyFixedSmall;
typedef FIXED_UNSIGNED(16, 16) MyFixedBig;

void main(void)
{
    MyFixedSmall fixed1;
    MyFixedBig fixed2;
    // Assign the value 15.5
    fixed1 = FixedLiteral(FIXED_ISUNSIGNED, 4, 4, 15.5);
    // Cast to the larger width
    fixed2 = FixedCastUnsigned(FIXED_ISUNSIGNED, 16, 16, fixed1);
}
```

The result is still 15.5 but stored as a fixed-point number with a different width:

```
fixed2.FixedIntBits = 15;
fixed2.FixedFracBits = 32768;
```

1.5.6 FixedDivSigned

FixedDivSigned(***Fixed1***, ***Fixed2***);

Arguments

Fixed1	Fixed-point structure of signed type and any width
Fixed2	Fixed-point structure of signed type and the same width

Return values

Fixed-point number of signed type and the same width as ***Fixed1*** and ***Fixed2***.

Description

Divisor for signed fixed-point numbers only. Returns ***Fixed1*** divided by ***Fixed2***. The number returned is of the same width as ***Fixed1*** so any bits outside this width are lost.

Requirements

Header file:	fixed.hch
Library file:	fixed.hcl

Example

This example shows division on FIXED_SIGNED(4, 4).

```
#include <fixed.hch>
set clock = external "P1";
typedef FIXED_SIGNED(4, 4) MyFixed;

void main(void)
{
    MyFixed fixed1, fixed2, fixed3;
    // Give the fixed-point number value 5
    fixed1 = FixedLiteral(FIXED_ISSIGNED, 4, 4, 5);
    // Give the fixed-point number value 4
    fixed2 = FixedLiteral(FIXED_ISSIGNED, 4, 4, 4);
    // Multiply these numbers
    fixed3 = FixedDivSigned(fixed1, fixed2);
}
```

The result is 1.25. This is stored as:

```
fixed3.FixedIntBits = 1;
fixed3.FixedFracBits = 4;
```

1.5.7 FixedDivUnsigned

FixedDivUnsigned(***Fixed1***, ***Fixed2***);

Arguments

Fixed1	Fixed-point structure of unsigned type and any width
Fixed2	Fixed-point structure of unsigned type and the same width

Return values

Fixed-point number of unsigned type and the same width as ***Fixed1*** and ***Fixed2***.

Description

Divisor for unsigned fixed-point numbers only. Returns ***Fixed1*** divided by ***Fixed2***. The number returned is of the same width as ***Fixed1*** so any bits outside this width are lost.

Requirements

Header file:	fixed.hch
Library file:	fixed.hcl

Example

This example shows division on FIXED_UNSIGNED(4, 4).

```
#include <fixed.hch>
set clock = external "P1";
typedef FIXED_UNSIGNED(4, 4) MyFixed;

void main(void)
{
    MyFixed fixed1, fixed2, fixed3;
    // Give the fixed-point number value 15
    fixed1 = FixedLiteral(FIXED_ISUNSIGNED, 4, 4, 15);
    // Give the fixed-point number value 2
    fixed2 = FixedLiteral(FIXED_ISUNSIGNED, 4, 4, 2);
    // Multiply these numbers
    fixed3 = FixedDivUnsigned(fixed1, fixed2);
}
```

The result is 7.5. This is stored as:

```
fixed3.FixedIntBits = 7;
fixed3.FixedFracBits = 8;
```

1.5.8 FixedEq

FixedEq(***Fixed1, Fixed2***);

Arguments

Fixed1	Fixed-point structure of any type and width
Fixed2	Fixed-point structure of the same type and width

Return values

Single bit wide integer with 0 as false and 1 as true.

Description

Returns true if ***Fixed1*** equals ***Fixed2***.

Requirements

Header file:	fixed.hch
Library file:	fixed.hcl

Example

This example tests the equality of two FIXED_UNSIGNED(16, 16).

```
#include <fixed.hch>
set clock = external "P1";
typedef FIXED_UNSIGNED(16, 16) MyFixed;

void main(void)
{
    unsigned int 1 result;
    MyFixed fixed1, fixed2;
    // Give the fixed-point number value 1000.046875
    fixed1 = FixedLiteralFromInts(FIXED_ISUNSIGNED, 16, 16, 1000,
         3072);
    // Give the fixed-point number value 1000.03125
    fixed2 = FixedLiteralFromInts(FIXED_ISUNSIGNED, 16, 16, 1000,
         2048);
    // Are these numbers equal?
    result = FixedEq(fixed1, fixed2);
}
```

fixed1 is not equal to ***fixed2*** so:

```
result = 0;
```

1.5.9 FixedFracWidth

FixedFracWidth(***Fixed***);

Arguments

Fixed	Fixed-point structure of any type and width

Return values

Compile time constant integer.

Description

Returns width of the fraction part of ***Fixed***.

Requirements

Header file:	fixed.hch
Library file:	fixed.hcl

Example

This example finds the width of the fraction part of a FIXED_SIGNED(16, 8).

```
#include <fixed.hch>
set clock = external "P1";
typedef FIXED_SIGNED(16, 8) MyFixed;

void main(void)
{
    unsigned int 5 result;
    MyFixed fixed;
    // Find the width
    result = FixedFracWidth(fixed);
}
```

The result is 8.

1.5.10 FixedGT

FixedGT(***Fixed1***, ***Fixed2***);

Arguments

Fixed1	Fixed-point structure of any type and width
Fixed2	Fixed-point structure of the same type and width

Return values

Single bit wide integer with 0 as false and 1 as true.

Description

Returns true if ***Fixed1*** is greater than ***Fixed2***.

Requirements

Header file:	`fixed.hch`
Library file:	`fixed.hcl`

Example

This example tests for greater than of two `FIXED_SIGNED(4, 16)`.

```
#include <fixed.hch>
set clock = external "P1";
typedef FIXED_SIGNED(4, 16) MyFixed;

void main(void)
{
    unsigned int 1 result;
    MyFixed fixed1, fixed2;
    // Give the fixed-point number value 5.125
    fixed1 = FixedLiteral(FIXED_ISSIGNED, 4, 16, 5.125);
    // Give the fixed-point number value –5.125
    fixed2 = FixedLiteral(FIXED_ISSIGNED, 4, 16, -5.125);
    // Is fixed1 > fixed2
    result = FixedGT(fixed1, fixed2);
}
```

fixed1 is greater than ***fixed2*** so:

```
result = 1;
```

1.5.11 FixedGTE

FixedGTE(***Fixed1***, ***Fixed2***);

Arguments

Fixed1	Fixed-point structure of any type and width
Fixed2	Fixed-point structure of the same type and width

Return values

Single bit wide integer with 0 as false and 1 as true.

Description

Returns true if ***Fixed1*** is greater than or equal to ***Fixed2***.

Requirements

Header file:	fixed.hch
Library file:	fixed.hcl

Example

This example tests for greater than or equal to of two FIXED_SIGNED(4, 16).

```
#include <fixed.hch>
set clock = external "P1";
typedef FIXED_SIGNED(4, 16) MyFixed;

void main(void)
{
    unsigned int 1 result;
    MyFixed fixed1, fixed2;
    // Give the fixed-point number value 5.125
    fixed1 = FixedLiteral(FIXED_ISSIGNED, 4, 16, 5.125);
    // Give the fixed-point number value –5.125
    fixed2 = FixedLiteral(FIXED_ISSIGNED, 4, 16, -5.125);
    // Is fixed1 > fixed2
    result = FixedGTE(fixed1, fixed2);
}
```

fixed1 is greater than or equal to ***fixed2*** so:

```
result = 1;
```

1.5.12 FixedIntWidth

FixedIntWidth(***Fixed***);

Arguments

Fixed	Fixed-point structure of any type and width

Return values

Compile time constant integer.

Description

Returns width of the integer part of ***Fixed***.

Requirements

Header file:	fixed.hch
Library file:	fixed.hcl

Example

This example finds the width of the integer part of a FIXED_SIGNED(16, 8).

```
#include <fixed.hch>
set clock = external "P1";
typedef FIXED_SIGNED(16, 8) MyFixed;

void main(void)
{
    unsigned int 5 result;
    MyFixed fixed;
    // Find the width
    result = FixedIntWidth(fixed);
}
```

The result is 16.

1.5.13 FixedLeftShift

FixedLeftShift(***Fixed***, ***Shift***);

Arguments

Fixed	Fixed-point structure of any type and width
Shift	Number of bits to shift left by

Return values

Fixed-point number of same type and width as ***Fixed***.

Description

Returns ***Fixed*** shifted left by ***Shift*** number of bits. The number returned is of the same width as ***Fixed*** so any bits shifted outside this width are lost.

The ***Shift*** expression must be unsigned and of width

shiftWidth = log2ceil (***intWidth*** + ***fracWidth*** + 1)

where *intWidth* is width(***Fixed***.FixedIntBits) and ***fracWidth*** is ***width***(***Fixed***.FixedFracBits) (as defined in FIXED_SIGNED and FIXED_UNSIGNED .)

Shift has the range: 0 to exp2 (***shiftWidth***) - 1.

If ***Shift*** is 0 no shift occurs. Shifts of (***intWidth*** + ***fracWidth***) or greater shift all the bits out of ***Fixed*** and produce a zero result.

Requirements

Header file:	fixed.hch
Library file:	fixed.hcl

Example

This example shows left shifting on a FIXED_UNSIGNED(8, 4). The integer part has value 9 and the fraction part has value ½.

```
#include <fixed.hch>
set clock = external "P1";
typedef FIXED_UNSIGNED(8, 4) MyFixed;

void main(void)
{
    MyFixed fixed1, fixed2;
    // Give the fixed-point number value 9.5
    fixed1 = FixedLiteralFromInts(FIXED_ISUNSIGNED, 8, 4, 9, 8);
    // Shift this number left by 2 bits
    fixed2 = FixedLeftShift(fixed1, 2);
}
```

The result is 39. This is stored as:

```
fixed2.FixedIntBits = 38;
fixed2.FixedFracBits = 0;
```

1.5.14 FixedLiteral

FixedLiteral(***isSigned***, ***intWidth,*** ***fracWidth***, ***floatConst***);

Arguments

isSigned	Single bit wide unsigned integer with FIXED_ISSIGNED denoting signed and FIXED_ISUNSIGNED indicating unsigned. Must be a compile time constant.
intWidth	Width of integer part of the fixed-point structure. Must be positive and a compile time constant.
fracWidth	Width of fraction part of the fixed-point structure. Must be positive and a compile time constant.
floatConst	Floating-point constant value to assign value of fixed-point structure.

Return values

Fixed-point number of the type and width specified.

Description

Returns a signed fixed-point number if ***isSigned*** is FIXED_ISSIGNED or an unsigned fixed-point number if ***isSigned*** is FIXED_ISUNSIGNED. The number has the value ***floatConst*** with an integer part of width ***intWidth*** and a fraction part of width ***fracWidth***.

Requirements

Header file:	`fixed.hch`
Library file:	`fixed.hcl`

Example 1:

This example assigns values to a `FIXED_SIGNED(16, 8)`.

```
typedef FIXED_SIGNED(16, 8) MyFixed;
void main(void)
{
    MyFixed fixed;
    // Assign the value 32767.5
    fixed = FixedLiteral(FIXED_ISSIGNED, 16, 8, 32767.5);
}
```

This gives the structure the values:

```
fixed.FixedIntBits = 32767;
fixed.FixedFracBits = 128;
```

Example 2:

This example assigns values to a `FIXED_UNSIGNED(16, 8)`.

```
typedef FIXED_UNSIGNED(16, 8) MyFixed;
void main(void)
{
    MyFixed fixed;
    // Assign the value 32767.5
    fixed = FixedLiteral(FIXED_ISUNSIGNED, 16, 8, 32767.5);
}
```

This gives the structure the values:

```
fixed.FixedIntBits = 37267;
fixed.FixedFracBits = 128;
```

1. Fixed-point library

1.5.15 FixedLiteralFromInts

FixedLiteralFromInts(***isSigned***, ***intWidth,*** ***fracWidth***, ***intBits,*** ***fracBits***);

Arguments

isSigned	Single bit wide unsigned integer with FIXED_ISSIGNED denoting signed and FIXED_ISUNSIGNED indicating unsigned. Must be a compile time constant.
intWidth	Width of integer part of the fixed-point structure. Must be positive and a compile time constant.
fracWidth	Width of fraction part of the fixed-point structure. Must be positive and a compile time constant.
intBits	Value to set to the integer part of the fixed-point structure. Must be of width ***intWidth***.
fracBits	Value to set to the fraction part of the fixed-point structure. Must be of width ***fracWidth***.

Return values

Fixed-point number of the type and width specified.

Description

Returns a signed fixed-point number if ***isSigned*** is 1 or an unsigned fixed-point number if ***isSigned*** is 0. The number has an integer part ***intBits*** of width ***intWidth*** and a fraction part ***fracBits*** of width ***fracWidth***.

Requirements

Header file:	fixed.hch
Library file:	fixed.hcl

Example 1:

This example assigns values to a FIXED_SIGNED(16, 8).

```
typedef FIXED_SIGNED(16, 8) MyFixed;
void main(void)
{
    MyFixed fixed;
    // Assign the value 32767.5
    fixed = FixedLiteralFromInts(FIXED_ISSIGNED, 16, 8, 32767, 128);
}
```

This gives the structure the values:

```
fixed.FixedIntBits = 32767;
fixed.FixedFracBits = 128;
```

Example 2:

This example shows assigns values to a FIXED_UNSIGNED(16, 8).

```
typedef FIXED_UNSIGNED(16, 8) MyFixed;
void main(void)
{
    MyFixed fixed;
    // Assign the value 32767.5
    fixed = FixedLiteralFromInts(FIXED_ISUNSIGNED, 16, 8, 37267, 128);
}
```

This gives the structure the values:

```
fixed.FixedIntBits = 37267;
fixed.FixedFracBits = 128;
```

1.5.16 FixedLT

FixedLT(***Fixed1***, ***Fixed2***);

Arguments

Fixed1	Fixed-point structure of any type and width
Fixed2	Fixed-point structure of the same type and width

Return values

Single bit wide integer with 0 as false and 1 as true.

Description

Returns true if ***Fixed1*** is less than ***Fixed2***.

Requirements

Header file:	fixed.hch
Library file:	fixed.hcl

Example

This example tests for less than of two FIXED_UNSIGNED(4, 4).

```
#include <fixed.hch>
set clock = external "P1";
typedef FIXED_UNSIGNED(4, 4) MyFixed;

void main(void)
{
    unsigned int 1 result;
    MyFixed fixed1, fixed2;
    // Give the fixed-point number value 3.5
    fixed1 = FixedLiteral(FIXED_ISUNSIGNED, 4, 4, 3.5);
    // Give the fixed-point number value 3.5
    fixed2 = FixedLiteral(FIXED_ISUNSIGNED, 4, 4, 3.5);
    // Is fixed1 < fixed2
    result = FixedLT(fixed1, fixed2);
}
```

fixed1 is not less than ***fixed2*** so:

```
result = 0;
```

1.5.17 FixedLTE

FixedLTE(***Fixed1***, ***Fixed2***);

Arguments

Fixed1	Fixed-point structure of any type and width
Fixed2	Fixed-point structure of the same type and width

Return values

Single bit wide integer with 0 as false and 1 as true.

Description

Returns true if ***Fixed1*** is less than or equal to ***Fixed2***.

Requirements

Header file:	fixed.hch
Library file:	fixed.hcl

Example

This example tests for less than or equal to of two FIXED_UNSIGNED(4, 4).

```
#include <fixed.hch>
set clock = external "P1";
typedef FIXED_UNSIGNED(4, 4) MyFixed;

void main(void)
{
    unsigned int 1 result;
    MyFixed fixed1, fixed2;
    // Give the fixed-point number value 3.5
    fixed1 = FixedLiteralFromInts(FIXED_ISUNSIGNED, 4, 4, 3, 8);
    // Give the fixed-point number value 3.5
    fixed2 = FixedLiteralFromInts(FIXED_ISUNSIGNED, 4, 4, 3, 8);
    // Is fixed1 less than or equal to fixed2
    result = FixedLTE(fixed1, fixed2);
}
```

fixed1 is less than or equal to ***fixed2*** so:

```
result = 1;
```

1.5.18 FixedMultSigned

FixedMultSigned(***Fixed1***, ***Fixed2***);

Arguments

Fixed1	Fixed-point structure of signed type and any width
Fixed2	Fixed-point structure of signed type and the same width

Return values

Fixed-point number of signed type and the same width as ***Fixed1*** and ***Fixed2***.

Description

Multiplier for signed fixed-point numbers only. Returns ***Fixed1*** multiplied by ***Fixed2***. The number returned is of the same width as ***Fixed1*** so any bits outside this width are lost.

Requirements

Header file:	fixed.hch
Library file:	fixed.hcl

Example

This example shows multiplication on FIXED_SIGNED(1, 16).

```
#include <fixed.hch>
set clock = external "P1";
typedef FIXED_SIGNED(1, 16) MyFixed;

void main(void)
{
    MyFixed fixed1, fixed2, fixed3;
    // Give the fixed-point number value -0.5
    fixed1 = FixedLiteral(FIXED_ISSIGNED, 1, 16, -0.5);
    // Give the fixed-point number value -0.125
    fixed2 = FixedLiteral(FIXED_ISSIGNED, 1, 16, -0.125);
    // Multiply these numbers
    fixed3 = FixedMultSigned(fixed1, fixed2);
}
```

The result is 0.0625. This is stored as:

```
fixed3.FixedIntBits = 0;
fixed3.FixedFracBits = 4096;
```

1.5.19 FixedMultUnsigned

FixedMultUnsigned(***Fixed1***, ***Fixed2***);

Arguments

Fixed1	Fixed-point structure of unsigned type and any width
Fixed2	Fixed-point structure of unsigned type and the same width

Return values

Fixed-point number of unsigned type and the same width as ***Fixed1*** and ***Fixed2***.

Description

Multiplier for unsigned fixed-point numbers only. Returns ***Fixed1*** multiplied by ***Fixed2***. The number returned is of the same width as ***Fixed1*** so any bits outside this width are lost.

Requirements

Header file:	fixed.hch
Library file:	fixed.hcl

Example

This example shows multiplication on FIXED_UNSIGNED(1, 16).

```
#include <fixed.hch>
set clock = external "P1";
typedef FIXED_UNSIGNED(1, 16) MyFixed;

void main(void)
{
    MyFixed fixed1, fixed2, fixed3;
    // Give the fixed-point number value 0.5
    fixed1 = FixedLiteral(FIXED_ISUNSIGNED, 1, 16, 0.5);
    // Give the fixed-point number value 0.125
    fixed2 = FixedLiteral(FIXED_ISUNSIGNED, 1, 16, 0.125);
    // Multiply these numbers
    fixed3 = FixedMultUnsigned(fixed1, fixed2);
}
```

The result is 0.0625. This is stored as:

```
fixed3.FixedIntBits = 0;
fixed3.FixedFracBits = 4096;
```

1.5.20 FixedNeg

FixedNeg(***Fixed***);

Arguments

Fixed	Fixed-point structure of signed type and any width

Return values

Fixed-point number of same type and width as ***Fixed***.

Description

Returns the negative of ***Fixed***.

Requirements

Header file:	fixed.hch
Library file:	fixed.hcl

Example

This example negates a FIXED_SIGNED(4, 4).

```
#include <fixed.hch>
set clock = external "P1";
typedef FIXED_SIGNED(4, 4) MyFixed;

void main(void)
{
    MyFixed fixed1, fixed2;
    // Give the fixed-point number value -1.625
    fixed1 = FixedLiteralFromInts(FIXED_ISIGNED, 4, 4, -2, 6);
    // Find the negative of this number
    fixed2 = FixedNeg(fixed1);
}
```

The result is 1.625. This is stored as:

```
fixed2.FixedIntBits = 1;
fixed2.FixedFracBits = 10;
```

1.5.21 FixedNEq

FixedNEq(***Fixed1***, ***Fixed2***);

Arguments

Fixed1	Fixed-point structure of any type and width
Fixed2	Fixed-point structure of the same type and width

Return values

Single bit wide integer with 0 as false and 1 as true.

Description

Returns true if ***Fixed1*** does not equal ***Fixed2***.

Requirements

Header file:	fixed.hch
Library file:	fixed.hcl

Example

This example tests for non-equality of two FIXED_UNSIGNED(16, 16).

```
#include <fixed.hch>
set clock = external "P1";
typedef FIXED_UNSIGNED(16, 16) MyFixed;

void main(void)
{
    unsigned int 1 result;
    MyFixed fixed1, fixed2;
    // Give the fixed-point number value 1000.046875
    fixed1 = FixedLiteral(FIXED_ISUNSIGNED, 16, 16, 1000.046875);
    // Give the fixed-point number value 1000.03125
    fixed2 = FixedLiteral(FIXED_ISUNSIGNED, 16, 16, 1000.03125);
    // Are these numbers not equal?
    result = FixedNEq(fixed1, fixed2);
}
```

fixed1 is not equal to ***fixed2*** so:

```
result = 1;
```

1.5.22 FixedNot

FixedNot(***Fixed***);

Arguments

Fixed	Fixed-point structure of any type and width

Return values

Fixed-point number of the same type and width as ***Fixed***.

Description

Returns bitwise NOT of ***Fixed***.

Requirements

Header file:	fixed.hch
Library file:	fixed.hcl

Example

This example finds the bitwise NOT of a FIXED_SIGNED(4, 4).

```
#include <fixed.hch>
set clock = external "P1";
typedef FIXED_SIGNED(4, 4) MyFixed;

void main(void)
{
    MyFixed fixed1, fixed2;
    // Give the fixed-point number value -5.875
    fixed1 = FixedLiteral(FIXED_ISSIGNED, 4, 4, -5.875);
    // Find the bitwise not of this number
    fixed2 = FixedNot(fixed1);
}
```

The result is 5.8125. This is stored as:

```
fixed2.FixedIntBits = 5;
fixed2.FixedFracBits = 13;
```

1.5.23 FixedOr

FixedOr(***Fixed1***, ***Fixed2***);

Arguments

Fixed1	Fixed-point structure of any type and width
Fixed2	Fixed-point structure of the same type and width

Return values

Fixed-point number of the same type and width as ***Fixed1*** and ***Fixed2***.

Description

Returns bitwise inclusive OR of ***Fixed1*** and ***Fixed2***.

Requirements

Header file:	fixed.hch
Library file:	fixed.hcl

Example

This example finds the bitwise OR of two FIXED_SIGNED(5, 5).

```
#include <fixed.hch>
set clock = external "P1";
typedef FIXED_SIGNED(5, 5) MyFixed;

void main(void)
{
    MyFixed fixed1, fixed2, fixed3;
    // Give the fixed-point number value -1
    fixed1 = FixedLiteral(FIXED_ISSIGNED, 5, 5, -1);
    // Give the fixed-point number value 0.96875
    fixed2 = FixedLiteral(FIXED_ISSIGNED, 5, 5, 0.96875);
    // Or these numbers
    fixed3 = FixedOr(fixed1, fixed2);
}
```

The result is -0.03125. This is stored as:

```
fixed3.FixedIntBits = -1;
fixed3.FixedFracBits = 31;
```

1.5.24 FixedRightShift

FixedRightShift(***Fixed***, ***Shift***);

Arguments

Fixed	Fixed-point structure of any type and width
Shift	Number of bits to shift right by

Return values

Fixed-point number of same type and width as ***Fixed***

Description

Returns ***Fixed*** shifted right by ***Shift*** number of bits. The number returned is of the same width as ***Fixed*** so any bits shifted outside this width are lost.

When shifting unsigned values, the right shift pads the upper bits with zeros. When shifting signed values, the upper bits are copies of the top bit of the original value. Thus a shift right by 1 divides the value by 2 and preserves the sign.

The ***Shift*** expression must be unsigned and of width

shiftWidth = log2ceil (***intWidth*** + ***fracWidth*** + 1) where ***intWidth*** is width(***Fixed***.FixedIntBits) and ***fracWidth*** is width(***Fixed***.FixedFracBits) (as defined in FIXED_SIGNED and FIXED_UNSIGNED)

Shift has the range: 0 to exp2 (shiftWidth) - 1.

If ***Shift*** is 0 no shift takes place. If *Shift* is (***intWidth*** + ***fracWidth***) all the bits are shifted out of ***Fixed***.

Requirements

Header file:	fixed.hch
Library file:	fixed.hcl

Example

This example shows right shifting on a FIXED_SIGNED(4, 4).

```
#include <fixed.hch>
set clock = external "P1";
typedef FIXED_SIGNED(4, 4) MyFixed;

void main(void)
{
    MyFixed fixed1, fixed2;
    // Give the fixed-point number value –0.75
    fixed1 = FixedLiteralFromInts(FIXED_ISSIGNED, 4, 4, -1, 4);
    // Shift this number right by 1 bit
    fixed2 = FixedRightShift(fixed1, 1);
}
```

The result is –0.375. This is stored as:

```
fixed2.FixedIntBits = -1;
fixed2.FixedFracBits = 10;
```

1.5.25 FixedSub

FixedSub(***Fixed1***, ***Fixed2***);

Arguments

Fixed1	Fixed-point structure of any type any width
Fixed2	Fixed-point structure of the same type and width

Return values

Fixed-point number of the same type and width as ***Fixed1*** and ***Fixed2***.

Description

Returns ***Fixed2*** subtracted from ***Fixed1***. The number returned is of the same width as ***Fixed1*** so any bits outside this width are lost.

Requirements

Header file:	fixed.hch
Library file:	fixed.hcl

Example

This example shows subtraction on a FIXED_SIGNED(2, 4).

```
#include <fixed.hch>
set clock = external "P1";
typedef FIXED_SIGNED(2, 4) MyFixed;

void main(void)
{
    MyFixed fixed1, fixed2, fixed3;
    // Give the fixed-point number value 1.0625
    fixed1 = FixedLiteral(FIXED_ISSIGNED, 2, 4, 1.0625);
    // Give the fixed-point number value 1.125
    fixed2 = FixedLiteral(FIXED_ISSIGNED, 2, 4, 1.125);
    // Subtract fixed2 from fixed1
    fixed3 = FixedSub(fixed1, fixed2);
}
```

The result is –0.0625. This is stored as:

```
fixed2.FixedIntBits = -1;
fixed2.FixedFracBits = 15;
```

1.5.26 FixedToBits

FixedToBits(***Fixed***);

Arguments

Fixed	Fixed-point structure of any type and width

Return values

Integer with type the same as ***Fixed*** and width of the sum of the widths of the integer and fraction parts of ***Fixed***.

Description

Returns the integer and fraction parts of ***Fixed*** concatenated together.

Requirements

Header file:	fixed.hch
Library file:	fixed.hcl

Example

This example extracts the bits of a FIXED_UNSIGNED(4, 4).

```
#include <fixed.hch>
set clock = external "P1";
typedef FIXED_UNSIGNED(4, 4) MyFixed;

void main(void)
{
    unsigned int 8 result;
    MyFixed fixed;
    // Assign the value 12.125
    fixed = FixedLiteral(FIXED_ISUNSIGNED, 4, 4, 12.125);
    // Find the type
    result = FixedToBits(fixed);
}
```

The result is equal to $12 \times 2^4 + 2$ = 194:

```
result =0b11000010; // binary number
```

1.5.27 FixedToBool

FixedToBool(***Fixed***);

Arguments

Fixed	Fixed-point structure of any type and width

Return values

Single bit wide integer with 0 as false and 1 as true.

Description

Returns 0 if the integer and fraction values of ***Fixed*** are equal to zero and 1 otherwise. FixedToBool(x) is equivalent to FixedNEq(***x***, ***Zero***), where ***Zero*** is a fixed-point expression of value 0, and type the same as *x*.

Requirements

Header file:	fixed.hch
Library file:	fixed.hcl

Example

This example tests for not equal to 0 of a FIXED_UNSIGNED(4, 4).

```
#include <fixed.hch>
set clock = external "P1";
typedef FIXED_UNSIGNED(4, 4) MyFixed;

void main(void)
{
    unsigned int 1 result;
    MyFixed fixed;
    // Assign the value 8
    fixed = FixedLiteralFromInts(FIXED_ISUNSIGNED, 4, 4, 8, 0);
    // Find the type
    result = FixedToBool(fixed);
}
```

The result is true:

```
result = 1;
```

1.5.28 FixedToInt

FixedToInt(***Fixed***);

Arguments

Fixed	Fixed-point structure of any type and width

Return values

Integer of same type and width as the integer part of the fixed-point structure.

Description

Returns the integer part of the fixed-point number, rounded towards minus infinity.

Note that this behaviour is different from ISO-C, which rounds towards 0.

Requirements

Header file:	fixed.hch
Library file:	fixed.hcl

Example

This example extracts the integer part of a FIXED_SIGNED(16, 8).

```
#include <fixed.hch>
set clock = external "P1";
typedef FIXED_SIGNED(16, 8) MyFixed;

void main(void)
{
    signed int 16 result;
    MyFixed fixed;
    // Assign the value 32767.5
    fixed = FixedLiteral(FIXED_ISSIGNED, 16, 8, 32767.5);
    // Find the integer part of the fixed-point number
    result = FixedToInt(fixed);
}
```

The result is 32767.

1.5.29 FixedXor

FixedXor(***Fixed1***, ***Fixed2***);

Arguments

Fixed1	Fixed-point structure of any type and width
Fixed2	Fixed-point structure of the same type and width

Return values

Fixed-point number of the same type and width as ***Fixed1*** and ***Fixed2***.

Description

Returns bitwise XOR of ***Fixed1*** and ***Fixed2***.

Requirements

Header file:	fixed.hch
Library file:	fixed.hcl

Example

This example finds the bitwise XOR of two FIXED_SIGNED(5, 5).

```
#include <fixed.hch>
set clock = external "P1";
typedef FIXED_SIGNED(5, 5) MyFixed;

void main(void)
{
    MyFixed fixed1, fixed2, fixed3;
    // Give the fixed-point number value -1
    fixed1 = FixedLiteral(FIXED_ISSIGNED, 5, 5, -1);
    // Give the fixed-point number value 0.96875
    fixed2 = FixedLiteral(FIXED_ISSIGNED, 5, 5, 0.96875);
    // Xor these numbers
    fixed3 = FixedXor(fixed1, fixed2);
}
```

The result is –1. 03125. This is stored as:

```
fixed3.FixedIntBits = -2;
      fixed3.FixedFracBits = 31;
```
